

Epact Table from 1862 to 2032

The Epact refers to the additional number of days required to reconcile the lunar and solar years, as their durations differ. This calculation is instrumental in determining the count of lunations and moveable feasts, such as Easter. In esoteric-onomantic astrology, the Epact calculation, in conjunction with data obtained from the Table of addition coefficients, is employed to derive the Age of the Moon, that is, the number of days elapsed since the last new moon.
